CTX_ENTITY

The `CTX_ENTITY` package enables you to search for terms that are unknown to you without specifying a particular search text.

It does this by identifying names, places, dates, and other objects when they are mentioned in a document and by tagging each occurrence (called a mention) with its type and subtype. This process enables you to produce a structured view of a document that can later be used for text and data mining and more comprehensive intelligence analysis.

For the complete description of this package within the context of Oracle Text, see `CTX_ENTITY` in the *Oracle Text Reference*.
